

Case Study

HOSCH Building Automation

Industry

Building Automation, Building Management Systems, System Integration

Location

Teltow, Nuremberg, Hamburg, and Düsseldorf, Germany

Company size

Approximately 150 employees

docu tools Use Cases

Construction documentation, documentation of construction progress and workmanship, quality assurance, project communication, task management, and reporting

HOSCH
GEBÄUDEAUTOMATION

Much of our work is no longer visible once a project is completed. This makes it all the more important for us to document the quality of workmanship and construction progress in a transparent manner throughout the entire project. Today, docu tools is an integral part of our quality management system.

Johannes Schaeffe
Managing Director and COO, HOSCH Building Automation

Making Quality Visible: How HOSCH Building Automation Uses docu tools to transparently document construction progress and workmanship quality

HOSCH Building Automation develops and implements sophisticated building automation projects for modern office buildings and functional structures throughout Germany. Especially in technically complex construction projects, transparent documentation and clear communication are crucial. Many technical installations disappear behind drop ceilings or into utility shafts as a project progresses. Since 2024, HOSCH has relied on docu tools to track construction progress, work quality, and project status

The Challenge

- Document quality in a traceable manner and make information centrally available
- Document construction progress and work quality throughout the entire project
- Avoid conflicting versions of plans and the resulting misunderstandings
- Provide information centrally rather than through various individual solutions
- Ensure that all stakeholders have access to up-to-date information
- Keep clients and project partners informed of the current status in a clear and transparent manner

The Solution

- A centralised platform for all project work
- a central hub for documentation, project communication, task management and reporting and photo documentation pinned directly to digital plans;
- a shared, up-to-date plan status for all stakeholders;
- project-specific roles and permissions, as well as a customisable colour scheme;
- generate reports and analyses in no time at all;
- mobile use with iPads directly on site;
- a complete history even after individual construction phases have been completed

Current Situation and Outlook

Today, docu tools is an integral part of day-to-day project work at HOSCH. Documentation, project communication, task management and reporting are all brought together on a single platform. This streamlines processes; reports and analyses are available quickly, and clients are provided with a clear overview of the current status at all times. At the same time, it ensures that elements which are no longer visible once individual construction phases have been completed are still documented.

Schedule a consultation today and see for yourself the benefits of digital construction documentation!
